The Degraded Broadcast Channel with Non-Causal Action-Dependent Side Information

Yossef Steinberg

ISIT 2013

Problem formulation

The “regular” state-dependent BC:

- ▶ Channel encoder:

$$X_i = f(m_1, m_2, S^n) \quad (\text{non-causal SI})$$

$$X_i = f(m_1, m_2, S^i) \quad (\text{causal SI})$$

- ▶ $\frac{1}{n} \sum_{i=1}^n \Lambda(X_i) \leq \lambda$

$$P((\hat{m}_1, \hat{m}_2) \neq (m_1, m_2)) \leq \epsilon$$

Problem formulation

Action-dependent states:

Encoding is performed in two parts:

- ▶ Given the pair of messages, an *action sequence* A^n is created.
The actions generate a sequence of states S^n , via $P_{S|A}$. S^n is available at the encoder (causally or noncausally).
- ▶ The encoder produces the channel input as a function of the messages and the states S^n .

Problem formulation

Action-dependent states:

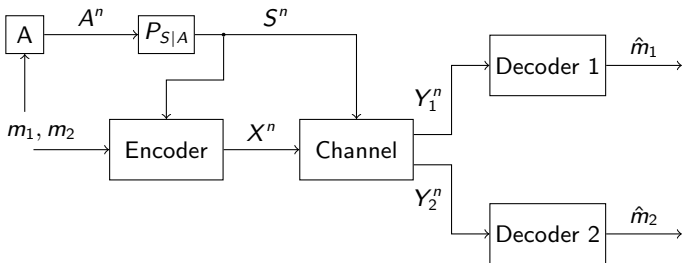

- ▶ Two possible models

$$X_i = f(m_1, m_2, S^n) \quad (\text{non-causal SI})$$

$$X_i = f(m_1, m_2, S^i) \quad (\text{causal SI})$$

Problem formulation

Action-dependent states:

- ▶ Two possible models

$$X_i = f(m_1, m_2, S^n) \quad (\text{non-causal SI})$$

$$X_i = f(m_1, m_2, S^i) \quad (\text{causal SI})$$

- ▶ Causal case solved [S & Weissman 2012], [Ahmedi & Simeone 2012].

Motivation

Problem
formulation

Motivation

The basic setup

Previous results

Main results

Summary & future
work

- ▶ Controlling the channel: sometimes, the user can affect the channel statistics (state), albeit at a certain cost.

Motivation

Problem
formulation

Motivation

The basic setup

Previous results

Main results

Summary & future
work

- ▶ Controlling the channel: sometimes, the user can affect the channel statistics (state), albeit at a certain cost.
- ▶ More specific channels: Channels (memories) with a rewrite option [Weissman 2010].

Motivation

Motivation

Problem
formulation

Motivation

The basic setup

Previous results

Main results

Summary & future
work

- ▶ Controlling the channel: sometimes, the user can affect the channel statistics (state), albeit at a certain **cost**.
- ▶ More specific channels: Channels (memories) with a rewrite option [Weissman 2010].
- ▶ Harvesting capacity with energy storage: Actions model the use of energy stored in the battery. Influence the channel state (=total energy in battery).
- ▶ Cost of retrieving side information.

Motivation

Cost of retrieving SI:

In “regular” channel coding with SI, state is produced by nature (not by actions). It is either *available* at the encoder, or *absent*. No intermediate situation, and no cost on retrieving it.

Motivation

Cost of retrieving SI:

Problem formulation

Motivation

The basic setup

Previous results

Main results

Summary & future work

Motivation

Cost of retrieving SI:

- S is produced by nature

Problem
formulation

Motivation

The basic setup

Previous results

Main results

Summary & future
work

Motivation

Cost of retrieving SI:

- ▶ S is produced by nature
- ▶ Side information is not available for free - we have to "go out and get it," or install expensive (and noisy) sensors to get it.

Motivation

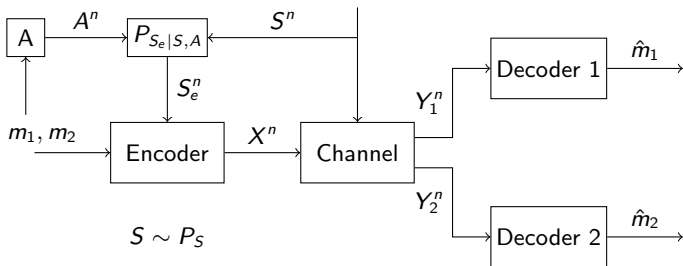

Cost of retrieving SI:

- ▶ S is produced by nature
- ▶ Side information is not available for free - we have to "go out and get it," or install expensive (and noisy) sensors to get it.
- ▶ The actions determine the availability (and quality) of side information at the encoder - S_e .

Motivation

Cost of retrieving SI:

Probing capacity. Introduced in the context of single user channels by Asnani, Permuter, & Weissman, 2010.

Problem formulation

The basic setup:

- ▶ Memoryless channel
- ▶ Non causal SI: $X_i = f(m_1, m_2, S^n)$
- ▶ Cost on input and actions:

$$\frac{1}{n} \sum_{i=1}^n \Lambda(A_i, X_i) \leq \lambda$$

State dependent BC

A state dependent BC $P_{Y_1, Y_2|S, X}$ is called physically degraded if

$$P_{Y_1, Y_2|S, X} = P_{Y_1|S, X} \cdot P_{Y_2|Y_1}$$

and stochastically degraded if

$$P_{Y_2|S, X}(y_2|s, x) = \sum_{y_1} P_{Y_1, Y_2|S, X}(y_1, y_2|s, x) \cdot W_{Y_2|Y_1}(y_2|y_1)$$

for *some* $W_{Y_2|Y_1}$.

Main results

Informed stronger decoder

- ▶ Even without actions, the state-dependent degraded BC with non-causal SI is still an open problem.
- ▶ Solved for the case where the stronger user is informed.

Main results

Informed stronger decoder

- ▶ Even without actions, the state-dependent degraded BC with non-causal SI is still an open problem.
- ▶ Solved for the case where the stronger user is informed.
- ▶ For the action-dependent case, we need to restrict the class of costs $\Lambda(A, X)$.

Main results

Informed stronger user

- ▶ *Separated cost functions* Λ^{sep} :

Each of the components of Λ depends either only on the actions or only on the channel input:

$$\begin{aligned}\Lambda_{k'}^{\text{sep}}(A^n, X^n) &= \Lambda_{k'}^{\text{sep}}(A^n), & 1 \leq k' \leq d', \\ \Lambda_k^{\text{sep}}(A^n, X^n) &= \Lambda_k^{\text{sep}}(X^n), & d' + 1 \leq k \leq d,\end{aligned}$$

for some $0 \leq d' \leq d$.
